

Minimum software installation for tutorials

This document outlines software installation for tutorials in the Neuropixels workshop repo: (<https://github.com/jenniferColonell/hands-on-neuropixels>). This short form installation assumes:

- The computer already has: github, conda environments (miniforge, anaconda, other), and a browser or python IDE to run Jupyter notebooks.
- That you'll download the sort results from the repo (skips sorting).

For step-by-step instructions for installing all the tools, see the document: [Example_Neuropixels analysis_installation.pdf](#)

1.) Clone the course repo: <https://github.com/jenniferColonell/hands-on-neuropixels>

2.) Create a conda environment:

```
conda create -n npix-test python=3.12 pandas natsort ipympl ipywidgets  
jupyterlab_widgets boto3 PyQt PyQtgraph jupyterlab zarr
```

Active the environment and then add these packages with pip:

```
python -m pip scikit-learn scipy
```

3.) Download the sorter output and visual stimuli

Open the notebook `/tutorials/AL_chronic_dataset/00_download_data.ipynb`. To download just the results and the stimulus times, run the first two cells.
